

The agreement decides what gets paid.

For research teams whose agents buy changing digital work from other agents, without supervising every exchange.

Human budget

Seller bills

25.00

DEMO

Still under budget. Still rejected by the chain.

Real Kiln / Qwen calls formed the deal. Both agents signed it. Sepolia rejected the inflated, genuinely signed bill and paid 20.00.

1

Negotiate the work

Three provider agents offer terms. The buyer counters. Every final term links to its original signed message.

2

Pay for successful units

The bundle run reserved 27.40 DEMO, paid 26.40 and returned 1.00. An injected failed request was not billed.

3

Carry the evidence out

Export one receipt. Recompute the work, verify both signatures, and check the exact chain calls without the app database.

5 live Kiln calls / 5 Sepolia transactions / 47 finalized checks

176 automated tests pass. Metered V3 also runs on a real local EVM.

A testnet prototype with explicit limits

Provider processes share one demo operator. Search uses a pinned corpus; compute uses CPU work, not rented GPUs. External business integration, human study and measured NPU power savings remain unverified.
