

Accord Lock

Budget 40. Agree 20.
Block 25.

Pay worker agents only for CAPEX table work that matches the agreement and buyer authority.

One-sentence declaration, build disclosure and run instructions

accord lock

Workspace / New task

AGENT WORK, ON YOUR TERMS

A budget is not a blank cheque.

For research teams buying quarterly CAPEX table work. Agree on the bill, then enforce it.

WORK THAT YOU CAN SEE

Budget 40.
Agree 20. Block 25.

A bill can fit your budget and still break the deal. Try a four-row CAPEX task and see both spending checks work.

[Try with a sample task](#)

Guided sample - authorized offers and overcharge - no real money

01 What needs to get done?

Set the work and the limits. You approve every payment.

Task name

Work brief

Supported workflow: normalize and validate source-linked quarterly CAPEX tables.

Bring your source table

CSV or JSON - up to 1 MB - 2025-2026 quarters

[Choose a file](#) [Download CSV template](#)

Required columns

Task budget	Per-deal limit	Delivery window
40	30	10

Test units have no cash value. In this private EVM, 1 unit = 1 gwel of a local test asset. No purchase or currency conversion.

A spending limit does not define the deal

The buyer permits 40. The agents agree on 20.

The seller invoices 25.

A budget-only check can accept that bill. Accord Lock checks the agreement before payment.

First user hypothesis: research teams buying short-lived data work.

Paid demand and independent supplier acceptance remain unvalidated.

How the payment boundary works

01 Human authority

Budget, per-deal cap, permitted sellers and deadline.

02 Kiln negotiation

Three providers; 22 quote, 20 counteroffer and acceptance.

03 Signed agreement

Buyer and seller commit to the same terms.

04 Settlement checks

Match delivery and billing to the agreement before payout.

Local demo: authored workers. Public proof: actual Kiln and Sepolia V2.

[Architecture, signed terms and the two execution paths](#)

RUN 1: an offer exceeds spending authority

35 requested > 30 per-deal limit

STOP RECORDED

No funding signature. No seller payment.

The task stays blocked. Its task ID, event ID and timestamp remain visible while a new task starts Run 2.

RUN 2: an invoice exceeds the agreement

40 budget 30 per-deal cap 20 agreed

25 invoiced: STOP

Within both spending limits, outside the agreement. The payout is blocked and 20 stays in escrow.

Correct to 20, then pay, verify and export the receipt.

The earlier stop remains recorded. Run 1 and Run 2 have different task IDs.

Two live local runs and the corrected local receipt

Historical public execution; not the local video task. Test ETH, gas separate.

[Raw per-flow Kiln usage, signed terms and all five transactions](#)

The negotiated agreement becomes executable

Autonomous negotiation can change the price. The agreed terms must survive through delivery, billing and settlement.

Enforced

The public V2 contract checks signed terms and exact amount. Model output does not hold the signing key.

Still trusted

The selected evaluator attests off-chain outcomes; signatures do not prove truth.

[Public V2 enforcement and stated limitations](#)

What is proven, and what comes next

Working evidence

Two separate stopped tasks, explicit reasons and receipts. A Kiln-negotiated public agreement that rejects overbilling.

Next customer test

Find research teams that buy machine work, measure invoice disputes, and test supplier acceptance of the settlement rules.

Author declaration: no previous-project code or assets reused.
