

PRODUCT

The agreement decides what gets paid.

Accord Lock helps research teams pay worker agents for CAPEX table work only when the invoice matches the negotiated Deal and human authority.

HUMAN AUTHORITY

40

Maximum delegated budget

KILN AGENTS AGREE

20

Seller offer 22 to Deal 20

SELLER INVOICES

25

Inside budget; outside Deal

25 < 40, but 25 != 20 -> BLOCK / REVERT

PROBLEM

A broad budget is not a payment instruction.

The first supported job normalizes four quarterly CAPEX rows with source references.

01

Human sets authority

Budget 40; a per-deal cap limits any single purchase.

02

Agents negotiate a Deal

A seller can offer 22; the buyer counters at 20; both sign terms.

03

The bill is checked against the Deal

A signed 25 invoice is rejected even though it is below 40.

WORKFLOW

Negotiate in language. Enforce in code.

The browser is a reproducible private-EVM demo. The DealTrace V2 run is separate actual Kiln + Sepolia proof.

Supported scope: source-linked CAPEX tables and bounded work bundles; not a general payment protocol.

TRACK B

Two out-of-scope runs. Two recorded stops.

Exact engine state: BLOCKED. Submission outcome: STOPPED. Each retains POLICY_CHECKED then TRANSACTION_BLOCKED.

RUN 1

STOPPED

Offer 35 exceeds per-deal 30

Reason: MAX_SINGLE

0 Kiln calls · 0 funding · 0 payment

RUN 2

STOPPED

Seller D is outside A/B/C

Reason: SELLER_ALLOWED

0 Kiln calls · 0 funding · 0 payment

Raw event chains: [artifacts/accord-lock/track-b-stops.json](#)

KILN

Five real qwen3-32b calls formed the public Deal.

Only language and negotiation used inference. Financial checks and verification used deterministic code.

FLOW	CALLS	INPUT	OUTPUT
Seller A: offer + response	2	1,730	1,648
Seller B: offer	1	793	658
Seller C: offer	1	797	923
Buyer: counteroffer	1	825	516
TOTAL	5	4,145	3,745

Raw request IDs, token records and timing: [report.json / usage\[\]](#)

BLOCKCHAIN

The 25 invoice is a mined revert, not a demo error.

V2 Sepolia stores the mandate and escrow, requires claim amount = locked Deal amount, then credits and withdraws 20.

STEP	STATUS	TX HASH (PREFIX)
Human mandate	confirmed	0xaf10d26f83bd13a1...
Fund Deal 20	confirmed	0xe0b17e51a52378b3...
Signed invoice 25	REVERTED	0x255d855d5e19779f...
Corrected invoice 20	confirmed	0x00b1e35d51542dac...
Seller withdrawal	confirmed	0x6a322e82f24b1fd1...

Independent finalized verification: VALID · 47 checks · block 11808905

REPRODUCE

Source, logs and checks are directly inspectable.

The one-page brief and previous films remain historical companion material; this is the current eight-page deck.

Try the browser

```
pnpm install --frozen-lockfile then pnpm ade:spending:view
```

Run the checks

```
pnpm ade:spending:test then pnpm ade:hosted:test then pnpm ade:test
```

Inspect raw evidence

Track B event capture; public run usage[]; five tx hashes; finalized verifier

209 / 209 escrow suite tests pass · 5 Kiln calls · 47 finalized checks

SCOPE AND DISCLOSURE

A bounded testnet prototype with an auditable boundary.

The initial repo commit after the event kickoff contained only a two-line README; the application and proof path appear in later commits.

BUILT DURING THE EVENT

Accord Lock workspace; Kiln buyer/seller negotiation; DealTrace evidence; escrow contracts; Sepolia run; verifier, tests, demo and deck.

LIMITS KEPT VISIBLE

Local workers are authored rules. Public V2 uses Kiln and Sepolia. No independent supplier, real first-time-user study, production custody review or measured NPU power.

Accord Lock makes the negotiated agreement the boundary for agent payment.
